ABSTRACT

Educational institutions accumulate large collections of examination questions across semesters, subjects, and difficulty levels, yet most still rely on scattered files, folders, and printed sheets to manage them. This lack of centralisation makes it difficult for teachers to efficiently search, filter, and retrieve suitable questions when preparing assessments, often resulting in repeated questions and inconsistent paper quality. The Question Bank Management System addresses this gap by providing a unified digital platform where questions can be added, categorised by subject, unit, difficulty level, and course outcome, and retrieved through advanced search and filtering capabilities. The system supports role-based access for administrators and faculty, enables automatic question paper generation based on selected criteria, and tracks question usage history to reduce duplication over time. By streamlining question storage and retrieval, the system significantly reduces the time and effort involved in examination preparation while improving the overall consistency and quality of assessments. This project demonstrates how thoughtful digital organisation can meaningfully enhance academic workflows for educational institutions.
